

Neveon Configurator for Flashlink and VikinX

Neveon Configurator

The Neveon Configurator is a configuration tool for Multicon-based systems, which allows graphical configuration of the control system. Neveon Configurator is a free tool available for Neveon customers. The Neveon Configurator auto-detects all equipment in the network and allows for user control of the VikinX or Flashlink installation. Note that the Neveon Configurator supports both configuration of VikinX router systems and Flashlink signal processing.

The graphical user interface has been redesigned to make setup of the Multicon system as easy as possible. The software uses specially developed wizards and drag & drop menus to guide operators through an installation process, quickly making all users productive, whatever their experience.

The Neveon Configurator also comes with a tree view of all Flashlink and VikinX devices detected in the network, providing easy access to Multicon element managers and controllers.

Note: Systems with SYSCON, ETH-CON, GYDA-SC, GYDA-VX controllers must be configured with the System Configurator.

Key features

- Supports configuration of virtual routers, salvos, parameters, levels, and mnemonics
- Automatic redundancy configuration
- Supports online and offline configuration
- Backup configuration may be exported and imported
- Auto-detection of supported equipment
- Button assignments for hardware and software control panels
- Configuration of IP settings
- Firmware upgrade
- License key management
